

The distribution and ecology of weevils (Coleoptera: Nemonychidae, Attelabidae, Apionidae, Curculionidae) in western Ukraine

Mieczysław MAZUR

Received: 15 Apr., 2002

Accepted for publication: 23 July, 2002

M. MAZUR. 2002. The distribution and ecology of weevils (Coleoptera: Nemonychidae, Attelabidae, Apionidae, Curculionidae) in western Ukraine. *Acta zoologica cracoviensis*, 45(3): 213-244.

Abstract: The list of 908 weevil species collected by 2001 in western Ukraine is presented. Information about their occurrence in 10 distinguished natural regions, preferred habitat and host plants for imagines is given.

Key words: Curculionoidea, geographical distribution, habitat preference, host plants, Ukraine.

Mieczysław MAZUR, Institut of Systematics and Evolution of Animals, Polish Academy of Science, Sławkowska 17, 31-016 Kraków, Poland.

I. INTRODUCTION

The aim of this paper is to present a list of all weevil species from the families: Nemonychidae, Attelabidae, Apionidae and Curculionidae collected in western Ukraine so far and to show their brief chorological and ecological characteristics. The knowledge of the fauna of this area, which in the period of Pleistocene glaciations was probably the refuge of many species, is of the key importance for understanding migrations from the east, which have shaped the present fauna of Poland. The above statement is particularly actual if referred to xerothermic species, among which the weevils have an important place.

The paper is based on abundant material (approx. 20.000 individuals representing 502 species) collected by the author in the course of field studies carried out during the period 1993-2000, and on data from the revised museum collections. An important additions to these are faunistic publications issued since about the mid of the 19th century (altogether some dozens of items). The lists of the relevant publications were given, among others, by KUNTZE & NOSKIEWICZ (1938), ROUBAL (1941), BURAKOWSKI et al. (1971), MAZUR & KUŚKA (1994) and KUBISZ et al. (1998). Many useful data were also found scattered in the systematic revisions of different weevil groups.

The study area (Fig. 1), comprising the western part of Ukraine, is limited from three sides by state boundaries with Belarus, Poland, Slovakia, Hungary, Romania and Moldova, and from one side by the eastern boundaries of two administrative districts: Vinnytsia and Zhytomyr. The area has been divided into 10 regions varying in terms of landscape and natural habitats (HERENCHUK et al. 1964). This division is a basis for the characteristics of the distribution of the weevils under discussion.

Fig. 1. Natural regions in western Ukraine (after HERENCHUK et al. 1964, simplified).

II. THE LIST OF SPECIES

In the after-mentioned list (Tab. 2) families are arranged in the systematical order, while species in alphabetical order. The occurrence of species is marked in the distinguished regions with a dot (●). When information on habitats and host plant was lacking, a question mark was put in the relevant place (columns II and III). Uncertain data, which need confirmation, are given in italic. For some species short notes are given under Table II.

To characterize ecological requirements of the discussed species it was necessary to classify their habitats. Humidity and temperature of habitats (criterion I) and a type of plant community (criterion II) were taken into account. Names of phytosociological units follow MEDWECKA-KORNAŚ et al. (1972). The results are shown in the table I.

The record of a type "h-m, B" means that a given species usually occurs in deciduous thickets, which develop in wet and moderately moist places (e.g. in riverine brushwood that is periodically flooded). Other characteristics of the species include: its affiliation to the groups of mono-, oligo- or polyphages and selection of host plants. Plant names follow MIREK et al. (1995), and in case of species not included in this publication, PROKUDYN (1987).

Table I

Classification of the weevils' habitats

Criterion	Symbol	Description
I	h	habitats permanently or periodically moist
	m	habitats moderately moist and moderately warm
	x	dry habitats, moderately warm
	xt	xerothermic habitats
II	F	forests
	F1	deciduous and mixed forests: associations from the class Querco-Fagetea, orchards, groups of trees in parks, at road-sides, among fields etc.
	F2	coniferous forests: associations from the class Vaccinio-Piceetea, plantations of coniferous trees
	B	thickets of shrubs and young deciduous trees
	A	water bodies: associations of water plants from the class Potametea
	P	bogs and marshes: associations from the classes Fragmitetea and Scheuchzerio-Caricetea
	H	tall-herb communities: vegetation of a type of Adenostylium alliariae along streams and rivers, in area depressions etc.
	M	meadows: associations from the class Molinio-Arrhenatheretum, pastures
	AL	alpine meadows and poor meadows from the order Nardetalia
	SO	halophilous vegetation
	G	grassland associations
	G1	xerothermic grasslands: associations from the class Festuco-Brometea
	G2	psammophilous grasslands: associations from the class Sedo-Scleranthesetia
	S	synanthropic habitats
	S1	wasteland, strips between fields, arable fields: vegetal communities from the order Secali-Violetalia
	S2	ruderal communities from the order Onopordetalia
	S3	buildings: dwelling-places, magazines etc.

III. NOTES

¹ Range: southern France, Italy, western Ukraine (two disjunct localities).

² Range (DIECKMANN 1977): Mediterranean region, Belgium, Netherlands, Great Britain. The occurrence in western Ukraine (ŁOMNICKI 1905) requires confirmation.

³ Range (WANAT 1995): Hungary, Romania, western Ukraine. This species was recorded from Ukraine as *Apion macrorrhynchum* EPPELSHEIM. The latter one (at present belonging to the genus *Ceratapion* SCHILSKY) occurs in the Balkan Peninsula and in Turkey.

⁴ Range (DIECKMANN 1977): Mediterranean countries. The occurrence in western Ukraine (ŁOMNICKI 1905) should be confirmed. The data from this country refer probably to *Squamapion hoffmanni* (WAGNER).

⁵ Range (WANAT 1997): Austria, Poland, Ukraine. This species was described in 1997.

⁶ Range (DIECKMANN 1982): France, Germany, Switzerland, Italy. The records from western Ukraine (RYBIŃSKI 1903a) could refer to the other species from the genus *Acalles* SCHOENHERR.

⁷ Range: western Ukraine, northern Romania. Endemic to the Eastern Carpathians.

⁸ Range: Slovakia, western Ukraine. Endemic to the Carpathians. In Slovakia a long series of the species was collected in moist moss growing near the cave entrance (FREMUTH 1971).

⁹ Range: western Ukraine, northern Romania. Endemic to the Eastern Carpathians.

¹⁰ Range (ZUMPT 1937): central and eastern part of the Mediterranean region. Its occurrence in western Ukraine (Podolia – ŁOMNICKI 1913) requires confirmation.

¹¹ Range (MAZUR & KUŚKA 1994): southern Poland, western Ukraine.

¹² Range (KOŠTAL 1991): Austria, Czech Rep., Slovakia, Hungary. According to KOŠTAL earlier records (ŁOMNICKI 1877, RYBIŃSKI 1903b) refer probably to *Brachysomus dispar*.

¹³ Range: Romania, western Ukraine. Endemic to the Eastern Carpathians.

¹⁴ Range: southeastern Poland, western Ukraine.

¹⁵ This species is little known. It has been recorded from southern Russia and western Ukraine until now.

¹⁶ Occurrence of this species in Ukraine is not documented with specimens in the collections examined by me. The published data (PENECKE 1928, KUNTZE 1933a) could refer to *Ceutorhynchus chlorophanus*.

¹⁷ Range: western Ukraine, northern Romania.

¹⁸ Range (TER-MINASSIAN 1988): Kazakhstan, Turkmenistan, Uzbekistan, Tajikistan, Iran. Its occurrence in western Ukraine (ŁOMNICKI 1877) is little probable.

¹⁹ Range: Hungary, Romania, western Ukraine, southeastern Poland.

²⁰ Range: western Ukraine.

²¹ Range: Romania, western Ukraine.

²² Range: southern Poland (one locality), western Ukraine (two localities).

²³ Occurrence of this species in L'viv (ŁOMNICKI 1874, 1886, 1905) and in the vicinity of Sambir (NOWICKI 1865) requires confirmation, because its host plant (*Glaucium flavum* CRANTZ) has never been collected there.

²⁴ Range: Caucasus. The occurrence of this species in western Ukraine (ŁOMNICKI 1904, 1905) needs confirmation.

²⁵ Range: western Ukraine (southern Podolia).

²⁶ Range (documented with specimens): northern Romania, western Ukraine, southeastern Poland. Records from Croatia, Austria and Germany are uncertain.

²⁷ Range: Algeria, southwestern Europa (east to Austria and Czech Rep.). Its occurrence in western Ukraine (NOWICKI 1865, ŁOMNICKI 1870, 1886) is doubtful.

²⁸ Range: Bosnia and Herzegovina, Romania, western Ukraine.

²⁹ Range: Mediterranean region. The occurrence in western Ukraine (Podolia – ŁOMNICKI 1913) requires confirmation.

³⁰ Range: Mediterranean region. Its occurrence in western Ukraine (ŁOMNICKI 1913) requires confirmation.

³¹ Range: Russia (western Caucasus, Kharkiv district), Ukraine (only single disjunct locality).

³² Alpine species; its occurrence in western Ukraine (ROUBAL 1941) is little probably.

³³ Endemic to the Carpathians.

³⁴ Occurrence of this species in western Ukraine (19 localities – NOWICKI 1858, 1865, 1870; BELKE 1859; WIERZEJSKI 1867; ŁOMNICKI 1868, 1870, 1880, 1882, 1886, 1905; KRÓL 1877) is not documented in the revised collections. The published data refer most probably to other *Liparus* species (*L. glabrirostris* and/or *L. transsylvaniaicus*).

³⁵ Range: western Ukraine (Podolia). Biology and ecology of this species is unknown; its taxonomic status needs also research.

³⁶ Range: western part of the Mediterranean region. The occurrence in western Ukraine (Uzhhorod – ROUBAL 1941) is doubtful.

³⁷ The record from western Ukraine (ŁOMNICKI 1886) requires confirmation, because it could be referred to other, closely related species from the genus *Miarus* SCHOENHERR (for example to *M. augeae*).

³⁸ Range: Hungary, western Ukraine.

³⁹ Range: western Ukraine (southern Podolia).

⁴⁰ Range: Slovakia, southern Poland, western Ukraine. This species has been separated by PODLUSSANY (1998) from *Omiamima hanakii* species complex.

⁴¹ Range: western Ukraine, Romania. In the latest revision of *Omiamima* SILFVERBERG species (PODLUSSANY 1998) *O. hanakii* was arranged in the new-described genus *Bryodaemon* PODLUSSANY and divided into two subspecies: *B. hanakii hanakii* and *B. hanakii montanus* (PETRI). In the western Ukraine only the nominal subspecies occurs. Record from Podolia (HILDT 1893) requires confirmation.

⁴² Range: Slovakia, southern Poland, western Ukraine, Romania. This species was separated from *Omiamima hanakii* in 1998.

⁴³ Range: Belarus (one locality), western Ukraine (one locality).

⁴⁴ Range: Slovakia, Romania, western Ukraine. Endemic to the Carpathians.

⁴⁵ Range: western Ukraine, Romania. Endemic to the Eastern Carpathians.

⁴⁶ The record from Ukraine (ŁOMNICKI 1886) refers probably to *Otiorhynchus obsidianus*.

⁴⁷ The record from Ukraine (ŁOMNICKI 1886) refers probably to *Otiorhynchus opulentus*.

⁴⁸ Range: Romania (Transsylvania). The record of this mountain species from Volhynia (LONA 1936) is unlikely.

⁴⁹ This species probably does not differ specific from *Otiorhynchus opulentus*, and its status needs further research.

⁵⁰ Range: Pyrenees. The records from Ukraine (ŁOMNICKI 1886) refer probably to *Otiorhynchus arcticus*.

⁵¹ Range: western Ukraine. Endemic to the Eastern Carpathians.

⁵² Range (disjunct): Croatia, western Ukraine, southeastern Poland.

⁵³ Range: Hungary, Slovakia, western Ukraine, eastern Poland.

⁵⁴ Range: Bulgaria, Bosna and Herzegovina. The record from Ukraine (ROUBAL 1941) refers probably to *Otiorhynchus noskiewiczi*.

⁵⁵ Alpine species; its occurrence in western Ukraine (not published data from the field notebook of M. RYBIŃSKI) is doubtful.

⁵⁶ Range: Ukraine (Crimea, Podolia).

⁵⁷ Range: from the Ussuri region (Russia) to Tauria (southern Ukraine). Its occurrence in Volhynia (DALLA TORRE & EMDEN 1936) seems little probably, and requires confirmation.

⁵⁸ Range: Hungary, Slovakia, western Ukraine.

⁵⁹ In western Ukraine the species was collected only in old battens in L'viv.

⁶⁰ Range: western part of the Mediterranean region. The record from Ukraine (SMRECZYŃSKI 1934) refers probably to *Pseudorchestes ermischi*.

⁶¹ Range: Slovakia, Romania, Moldova, western Ukraine.

⁶² Range: Bulgaria, western Ukraine (locus typicus).

⁶³ Range: the Eastern Alps, western Ukraine (disjunct locality in Chornohora mountain). Data from (ARNOLDI et al. 1965) should be confirmed.

⁶⁴ Occurrence of this species in western Ukraine (ŁOMNICKI 1886) requires confirmation, because this record could refer to *Sitona griseus*.

⁶⁵ Some literature data could refer to the later described *Tachyerges pseudostigma*.

⁶⁶ Range: Moldova, northern Romania, western Ukraine.

⁶⁷ The occurrence in western Ukraine (Zastavna - PENECKE 1932) requires confirmation.

⁶⁸ Range: western Ukraine.

⁶⁹ The occurrence north of the Carpathian arch (Carpathian Foothills – ARNOLDI et al. 1965) requires confirmation.

⁷⁰ This species was recorded from the Carpathians in former USSR, without further details (ARNOLDI et al. 1965).

⁷¹ This species was recorded from the Carpathian Foothills in former USSR, without further details (ARNOLDI et al. 1965).

Table II

List of the weevils collected in western Ukraine until now. Symbols of the regions: 1 – Volhynian Polissia (Volynsk'ke Polissia), 2 – Volhynian Upland (Volyns'ka Vysochyna), 3 – Male Polissia, 4 – Roztochchia, 5 – Opillia, 6 – Podolia Upland (Podil's'ka Vysochyna), 7 – Carpathian Foothills (Perekarpattia), 8 – Pruto-Dnistrov's'ke Mezhyrichchia, 9 – the Carpathians (Karpaty), 10 – Zakarpattia. Explanations of the remaining symbols are given in the table I (habitats) and below the table II (host plants)
